

## Print Exec LighT 1.3.16 Custom Configurations Template

To copy settings from one PC to another – and NEW SET UP: After install but before running - On the configured/working PC, look under, Program Files\Print Exec LT\system, you will see a folder labeled 'persist\_1' (or 2), and two files named 'pst\_table.pst' and 'system.properties'. Copy these files and transfer them over to the new PC (same relative path). Also, back them up to a safe place. Change directory properties – turn off “read only”.

PELT requires that each PC be installed and activated separately (unless you copied). To help with multiple custom Configurations, use this check list to ensure that all users are configured the same, or for testing and troubleshooting. Note: The “Factory” configuration cannot be changed, but can be copied to start a new one. Any config can be renamed. There is no limit to the number of configs, but 25 is a practical maximum and, the fewer, the better. The controller must also be configured properly although PELT will override, use Settings Editor and KeyOperator view, to check.

Name of Configuration >>	<u>Typical</u>			
<b>General Job Settings</b>				
Copies	1
